

LUPINIZAM

STEPHAN LUPINO

Lupino has coined the term 'Lupinizam' to define his philosophy with inter-woven recurrent themes and motifs at the core of his work; the struggle to represent the fragile beauty in nature and human existence, the unsettling contemplation of the afterlife, the ebb and flow of war and peace, and the spectrum of human behavior and sexuality with its concomitant joy, guilt and despair. Inspiration and influences include the biblical and literary themes of paradise lost and other western religious symbols, the concept of redemption, and motifs from African tribal art.

In his own words, Lupino describes Lupinizam as a strong, cosmic, crazy, futuristic energy tens of years in the future. "I used to say back when I was 20 years ahead but now I believe I am 100 years ahead". And it is this paradoxical dilemma of human existence - transitory beauty, mortality and an afterlife of damnation (influenced by a Christian ethos) - which plays out on the canvas and in the sculpted exhibits.

Lupino's pieces are at first sight familiar but on closer inspection, the inner core of the work reveals a complex symbiosis where elements and emotions are polarized and barely discernible mutations of natural forms reflect his visionary interpretation of what life and experience might be like 100 years from now.

CHALLENGING CONCEPTIONS

These visions of the future are sensual, often sexualized figures devoid of emotion. Lupino manages to fuse beauty with the ugliness of the human condition. There is a palpable yet unsettling sexuality about his figures, a disdain and emptiness as they stand or sit in relief against the backdrop of an indifferent universe. The artist also takes familiar iconic art and reinterprets it with his own twist. A metal bust is charged with sexual tension but, like the Venus de Milo, it is not quite whole.

There are multiple interpretations of the Madonna and Child - in portrait photography, in painting and in sculptures - where a mother stares down at her child in a mixture of detached affection and bewilderment. Angels and demons loom large in studios but are also found in the texture of his multi-layered acrylic paintings.

ART TO ARCHITECTURE

For the last fifteen years, Lupino replaced the camera with a chainsaw, hammer, chisel, grinder, massive old oak wood, iron, bronze, stone slabs, and other robust materials, to take his first step out of photography into the design of unique furniture. Lupino does not fail to remind us of the absolute justice of God—by which the same fate awaits both king and beggar—and we remain completely aware not only of our own mortality but also of the transience of all cultures, which are, from their inception, condemned to the irrevocable ruin of their civilizations.

EXPLORING STYLES

Lupinizam is by no means the result of vanity. It is the style of an individual artist who bravely walks the contemporary world alone—a world long devoid of any kind of style around which, like in the past, all art categories could organize their expression. In the 20th century, after a historical sequence of stylistic concepts, modernity finally turned its back on tradition, foreseeing at its end the impending emptiness of the postmodern age, whose vast environment gave the artist absolute freedom but also became his greatest curse because he was left with nothing to cling to.

As an artist deeply immersed in reality, he boldly heralds a world yet to come in a series of thematically related cycles titled *The Fifth Element*, *Another World*, *The Apocalyptic World*, and *The Cataclysm*, where, despite the gloomy reality, he sees expressiveness and beauty, even when he speaks—in visual terms—of an apocalypse in the wake of dystopian surrealism in which the eternal struggle between good and evil takes place. APPRECIATION

JUMP THE ART QUEUE

Art has always been a fascinating field, with an ever-growing number of artists creating unique and innovative pieces. In recent years, the world of art has experienced a significant shift, with many newer and lesser-known artists achieving cult status and seeing remarkable gains in the value of their artwork.

One of the most notable accomplishments in this space is how art has outperformed many traditional asset classes, including real estate and gold. As art continues to flourish, the competitive atmosphere around it grows, with new artists joining the industry and making their mark, bringing their own unique style and creativity to the field.

GOOD VIBRATION

In 1957, Jerry Lee Lewis made famous the song “A Whole Lot Of Shakin' Going On”. That song, revolutionised the music world. 65 years later, we have a much greater understanding of the world around us and the shakin' going on has nothing to do with Jerry Lee Lewis or the dance craze his song created. This newfound knowledge will revolutionise and forever shake up our relationship with the world around us.

Quantum physics describes the universe as nothing more than vibrating strings of energy!

Everything in our world is made up of atoms. These atoms are in a constant state of motion and vibrate at speeds ranging from a single cycle every second to those that vibrate at trillions of cycles per second. It is the speed of these atoms that dictates whether it is a solid, liquid or gas.

As we learn more of the impact that this natural occurrence has on our world and as we discover the means to harness these subtle molecular vibrations, radical performance improvements can be seen in everything from agriculture to water and energy. Numerous trials have proven that even our personal health and wellbeing can be enhanced.

VIBRATING FROM WITHIN

One example that offers immense opportunities is the application of vibrational frequency to our electrical distribution system and the appliances or machinery that consume it. Through an optimised delivery system, we can reduce the amount of electrical energy consumed while concurrently decreasing our collective carbon footprint.

From the time it is generated to the point it is used, electrical energy is lost to inefficient and vibrationally inappropriate equipment. As much as 50% of the electrical energy originally generated is lost by copper wires, substations, switches, transformers and delivery systems. In your own home, the age of the electrical wiring combined with these same inefficiencies and imperfections inside machines, pumps and motors will all disrupt the smooth flow of electricity. This wasted electrical energy is paid by you the consumer.

The most obvious sign of an inefficient delivery system is heat. If you have ever held an electrical cord which has been in constant use powering a kitchen appliance or electrically operated tool, you can easily feel the build up of heat through the safety sheathing. This heat is just one sign of wasted electrical energy.

When the delivery system has been “tuned” to an optimum vibrational frequency, there can be immense improvements in electrical efficiencies. Numerous trials have demonstrated from 10% to as much as 40% reductions in energy use in optimised buildings when compared to untreated buildings. For most installations, the all important return on investment (ROI) is less than a year.

Trials and demonstrations have repeatedly shown 25% to 40% less electricity being consumed by air conditioners, freezers and refrigerators.

Some electrical motors have registered as much as 60% reductions in electricity consumption and it is not unusual to see as much as 20% overall electricity consumption reductions in buildings and manufacturing processes. Each year the world consumes more than 24,000 Tera watt hours of electricity.

1 Tera watt is equal to one trillion watts. If this frequency change was implemented throughout the world and reduced the amount of electrical energy consumed by just 10%, the savings would equal all the electricity needed to power 500 million North American sized homes. This would equate to approximately 5,750 billion Kg's of CO2 emission reductions/year.

That is a major accomplishment for a technology which treats molecules so small that they cannot be viewed without using sophisticated electronics.

*“Everything in Life is Vibration” –
Albert Einstein*

Another valuable energy source which can benefit from molecular tuning is that of batteries. Increased demand for batteries has created an industry valued at more than \$100 billion but major issues continue to hold back its true potential. Battery life remains an important stumbling block for their wider integration in all parts of society.

Preliminary results have shown that frequency treated batteries outlast untreated batteries by as much as 25%. Imagine getting 25% more mileage from electric vehicle batteries than they can offer now. Furthermore; optimised batteries have proven to recharge at a faster rate than untreated batteries

and because of the now corrected frequencies. Batteries will last far longer before needing replacement. Conditioning electrical systems is just the start. In preliminary testing, molecularly realigning the fuel your vehicle uses can improve performance from 10% to as much as 36% depending on the vehicle type.

The next major technological revolution is occurring right now. You may not see it or feel it, but in the coming years you will be able to control it and with that you will reduce the cost of your utility bills, improve your health and go faster and farther than you have ever gone before.

UNLIKE ANY OTHER

The Purosangue stands head and shoulders above the rest of the market thanks to its performance and comfort. It is the only car with these proportions to sport a mid-front-mounted, naturally-aspirated V12. Maranello's most iconic engine debuts in this brand new configuration to ensure the car unleashes more power than any other in the segment (725 cv).

The Purosangue offers class-leading performance figures (from 0 to 100 km/h in 3.3 s and from 0 to 200 in 10.6 s); the driving position and the heady, naturally-aspirated V12 soundtrack deliver an entirely new yet also entirely Ferrari driving experience. The fact that a vast array of comfort-focused content is provided as standard, such as the Burmester® audio system, and that the many optional extras including the brand-new Alcantara® upholstery, derived from certified recycled polyester, make the Purosangue the most complete four-door, four-seater in the segment.
